

**CHEM 548 Molecular Electronic Structure
Spring 2017**

- Room: Noyes Laboratory 162
Period: January 17 – May 2, TR 9:30 – 10:50 AM
- Instructor: So Hirata
Email: sohirata@illinois.edu
Phone: 217-244-0629
Office: CLSL A520
Office hours: TR 10:50 – 11:50 AM
- Required text: A. Szabo and N. S. Ostlund, "Modern Quantum Chemistry: Introduction to Advanced Electronic Structure Theory"
- Recommended texts: B. O. Roos, "Lecture Notes in Quantum Chemistry" I and II
T. Helgaker, P. Jørgensen, and J. Olsen, "Molecular Electronic Structure Theory"
I. Shavitt and R. J. Bartlett, "Many-Body Methods in Chemistry and Physics"
N. H. March, W. H. Young, and S. Sampanthar, "The Many-Body Problem in Quantum Mechanics"
R. D. Mattuck, "A Guide to Feynman Diagram in the Many-Body Problem"
- Objectives: This course is intended for graduate students who specialize in computational or theoretical quantum chemistry. Its goal is to have students acquire skills essential for developing new computational methodologies broadly applicable to atomic, molecular, solid-state chemistry. This course does not teach how to run computational chemistry programs. Instead, it teaches how to write computational chemistry programs and to derive formulas of the underlying theories. This course interleaves lectures on theories and computer programming projects. The lectures encompass advanced electronic structure methods, introductory band theory, and introductory quantum dynamics. The programming projects are fun.
- Exams: There will be no exams.
- Programming reports: There will be three computer programming projects. One or two lectures will introduce each project and students are asked to work on them individually or in small groups. Students who are not familiar with programming are strongly encouraged to take advantage of the instructor's office hours to seek hands-on assistance. Each student must write his/her own research-paper-style report and submit it to the instructor by the due date. Each student must have an access to a basic coding environment (a UNIX or LINUX computer or cluster with a C or Fortran compiler) and will be given one if he/she does not.
- Grades: Attendance and class participation 50%. Programming reports 50%. In grading the reports, given diverse prior programming experiences

of the students, emphasis is not placed on the correctness or completeness of the programs written.

Tentative schedules:

Date	Lecture topics	Project due
Jan 17	Project #1: Finite-difference method, basis-set method, Lagrange's undetermined multiplier method	
19	Slater determinants, Dirac bra-ket notations, orthogonal functions, unitary transformation, diagonalization, delta function	
24	Electronic structure overview, Hartree-Fock theory, full configuration-interaction theory	
26	Operators, molecular integrals, Slater-Condon rules	
31	Second quantization	
Feb 2	Project #2: Time-dependent perturbation theory, transition dipole moment, Franck-Condon principle, spectroscopies	
7	Project #2: Gaussian functions, Fourier transform, real and reciprocal spaces, correlation function	
9	Project #2: Wave packet propagation, phase and group velocities, Ehrenfest theorem, convolution theorem, path integrals	#1 due
14	Normal ordering, Wick's theorem	
16	Diagrams	
21	Hartree-Fock theory	
23	Programming day (no class)	
28	Molecular integrals over Gaussians	
Mar 2	Configuration-interaction theory	
7	Coupled-cluster theory	
9	Many-body perturbation theory	
14	Density-functional theory	
16	Project #3: Hückel and Su-Schrieffer-Heeger band structure calculations of 1D and 2D solids	#2 due
28	HF and DFT in density matrix form	
30	Time-dependent HF and DFT for excited states	
Apr 4	Programming day (no class)	
6	Programming day (no class)	
11	Coupled-cluster theory for excited states	
13	HF analytical gradients	
18	Programming day (no class)	
20	Programming day (no class)	
25	Crystal orbital theory	
27	Size consistency	
May 2	Green's function theory	#3 due
